# Project Design Phase-II

## Solution Requirements (Functional & Non-functional)

| | | | |
|---|---|---|---|
| **Date** | 03 October 2026 | **Team ID** | SWTID-2026-6328 |
| **Project Name** | Auto Ticket Classification using Flow Designer | **Maximum Marks** | 4 Marks |

### Functional Requirements:

Following are the functional requirements of the proposed solution.

| FR No. | Functional Requirement (Epic) | Sub Requirement (Story / Sub-Task) |
|---|---|---|
| **FR-1** | **Ticket Creation** | Create a new support ticket on the custom table ('Incident Workflow') with caller details and short description. |
| **FR-2** | **Ticket Validation** | Validate mandatory ticket information (Caller and Short Description) and ensure auto-numbering generation upon submission. |
| **FR-3** | **Automatic Flow Trigger** | Trigger the ServiceNow Flow Designer flow ('Auto Classify School IT Tickets') automatically when a new record is created with 'Category' as empty. |
| **FR-4** | **Ticket Classification** | Analyze Short Description keywords (Wi-Fi, Projector, Password, Slow) using Flow Designer If/Else If logic and assign Category and dependent Subcategory automatically. |
| **FR-5** | **Dependent Logic Handling** | Enforce backend dependent choice dictionary settings between Category and Subcategory (e.g., Network -> Wi-Fi, Hardware -> Projector, Access -> Forgot Password, Performance -> Slow Computer). |
| **FR-6** | **Automatic Assignment** | Support assigning classified tickets to the appropriate Assigned Group (sys_user_group) and Assigned To agent (sys_user). |
| **FR-7** | **Notification** | Automatically send confirmation email notification to the caller (Caller -> Email) upon ticket creation and auto-classification. |
| **FR-8** | **Agent Review** | Allow an IT support agent to review the automatically classified ticket and manually adjust Category or Subcategory if necessary. |
| **FR-9** | **Ticket Resolution** | Allow the support agent to update ticket state (New, In Progress, On Hold, Resolved, Closed) and record resolution notes. |
| **FR-10** | **Update Set Management** | Capture all table, dictionary dependency, and Flow Designer configurations in a Local Update Set ('Project Update Set') and export as XML for seamless migration. |

### Non-functional Requirements:

Following are the non-functional requirements of the proposed solution.

| NFR No. | Non-Functional Requirement | Description |
|---|---|---|
| **NFR-1** | **Usability** | The ticket submission and classification process should be simple, requiring minimal input (Caller and Short Description) from students and teachers. |
| **NFR-2** | **Security** | Only authorized users and support personnel should be able to access or modify ticket information according to role-based access control. |
| **NFR-3** | **Reliability** | Flow Designer automation executes consistently without scripting errors and captures data in a standardized, structured format. |
| **NFR-4** | **Performance** | Ticket auto-classification and email notification dispatch occur immediately upon record creation. |
| **NFR-5** | **Availability** | The ticket classification workflow is available continuously whenever the ServiceNow platform is active. |

| | | |
|---|---|---|
| **NFR-6** | **Maintainability & Scalability** | The no-code implementation using Flow Designer allows easy addition of new keywords, categories, or routing rules without complex code changes. |

Project focus: The solution uses ServiceNow Flow Designer to automate ticket classification, priority handling, assignment and notification, while allowing human review and correction where necessary.
