Empathy Map Canvas

Phase / Activity	Ideation Phase — Empathize & Discover
Date	3 October 2026
Team ID	SWTID-2026-6328
Project Name	**Auto Ticket Classification using Flow Designer**
Maximum Marks	4 Marks

Empathy Map Canvas Overview

An empathy map is a visual framework used to articulate knowledge about a user's behaviors, attitudes, and feelings. For the Auto Ticket Classification using Flow Designer project, this map captures the experience of Students, Teachers, and Helpdesk IT Support Staff who interact with school IT service requests daily.

Empathy Map Grid

THINK & FEEL	SEE
• 'Will my Wi-Fi or projector issue be fixed before my next class?' • 'Selecting technical categories manually is confusing and takes too long.' • 'I hope my support request doesn't get delayed in an unmonitored queue.' • Desires instant, accurate routing with minimal manual effort.	• Classroom projectors failing or refusing to power on during lectures. • Students locked out of school portals due to forgotten passwords. • IT support dashboards overflowing with unassigned, uncategorized tickets. • Unstable Wi-Fi connectivity in classrooms and school libraries.
HEAR	**SAY & DO**
• Peers saying: 'IT tickets take way too long to get processed.' • Teachers complaining: 'Network issues constantly disrupt class time.' • Helpdesk agents stating: 'We spend half our day	• Types short descriptions like 'WiFi not working' or 'Projector issue'. • Leaves category/subcategory blank due to confusion over technical choices. • Expects an immediate automated email confirmation

manually re-routing tickets.' • IT guidelines instructing users to pick the correct category/subcategory.	upon submitting. • Submits tickets quickly and checks email for resolution status.

Pain vs. Gain Analysis

PAIN (Fears, Frustrations, Obstacles)	GAIN (Wants, Needs, Success Metrics)
• Frustration over required dropdown choices (Category/Subcategory). • Delays in ticket routing caused by manual IT helpdesk review. • Downtime and lost classroom productivity due to unresolved technical faults. • Lack of immediate submission confirmation or status visibility.	• Auto Ticket Classification on ticket creation using Flow Designer keyword triggers. • Zero manual categorization effort required from end-users. • Automated email notification sent instantly upon incident submission. • Standardized, scalable, and zero-code backend maintenance in ServiceNow.
