Streamlining Service Desk: Auto Ticket Classification using Flow Designer

Project Design Phase: Proposed Solution Template

Date: October 3, 2026

Maximum Marks: 4 Marks

Team ID: SWTID-2026-6328

Project Name: Auto Ticket Classification

Proposed Solution Template:

Project team shall fill the following information in the proposed solution template.

S.No	Parameter	Description
1	**Problem Statement (Problem to be solved)**	Incoming incidents and requests are classified and routed manually by service desk agents. This causes misrouted tickets, repeated reassignments between teams, inconsistent categories and priorities, SLA breaches, and long resolution times. Agents spend a large part of their day triaging instead of resolving, and employees wait without knowing who is handling their issue.
2	**Idea / Solution description**	An end-to-end automated triage workflow built on ServiceNow using Flow Designer. When a ticket is created (portal, email, chat or phone), a flow reads the short description and description, classifies it by category, subcategory, priority and assignment group using keyword and rule-based logic with an optional predictive intelligence/NLU model, and updates the record. Low-confidence tickets are sent to a manual triage queue. The flow also assigns the right group, sets SLA, and notifies the caller of the ticket number and expected resolution through email or Microsoft Teams/Slack.
3	**Novelty / Uniqueness**	• Low-code automation using ServiceNow Flow Designer, replacing hardcoded business rules and legacy scripts. • Confidence-based routing: high-confidence tickets are auto-classified, uncertain ones go to a human review queue. • Feedback loop: agent corrections to category or assignment group are captured and used to refine rules and retrain the model. • Cross-channel coverage: the same classification logic applies to tickets from the portal, email, chat and Teams/Slack.

S.No	Parameter	Description
4	**Social Impact / Customer Satisfaction**	**Customer Satisfaction:** Faster first response, correct routing on the first attempt, and clear status updates for employees. **Operational Efficiency:** Cuts manual triage effort, reduces reassignment rates and improves SLA compliance. Target: up to 70% less manual triage time (to be validated in testing). **Employee Productivity:** Issues reach the right resolver sooner, so less downtime for employees and more time for agents on complex problems.
5	**Business Model (Revenue Model)**	**Internal Enterprise Value:** Cost reduction from saved triage hours across the service desk and fewer SLA penalties. **Commercial SaaS/Consulting Model:** A packaged, reusable classification flow and implementation service offered to enterprises modernizing their ServiceNow ITSM operations.
6	**Scalability of the Solution**	Highly scalable across any enterprise size. The modular Flow Designer framework can be extended to HR and facilities cases, new categories and languages, multi-region assignment rules, and additional automations such as auto-resolution of known issues, duplicate ticket detection and priority escalation, without redesigning the core workflow.
