Project Name	Auto Ticket Classification Flow
Maximum Marks	4 Marks

Project Overview

Project Name: Auto Ticket Classification Flow

Project Description: An automated flow that reads each new IT service desk ticket (short description and description), identifies the ticket type, category, subcategory and priority, and routes it to the correct assignment group without manual triage. Tickets the flow is not confident about are sent to a manual triage queue.

Project Version: v1.0

Testing Period: [Start Date] to [End Date]

Testing Scope

Features and functionalities to be tested:

- Automatic ticket type detection (Incident vs Service Request)
- Category and subcategory classification
- Priority assignment based on impact and urgency
- Assignment group routing
- Confidence threshold and fallback to manual triage
- Duplicate ticket detection
- Manual override and audit logging
- Notifications, error handling and access control

User stories / requirements to be tested:

- US-01: As a service desk agent, I want tickets classified automatically so that I do not spend time on manual triage.
- US-02: As a requester, I want my ticket routed to the right team the first time so that it is resolved faster.
- US-03: As a service desk manager, I want low-confidence tickets flagged for review so that misrouting is reduced.
- US-04: As an auditor, I want every classification decision logged so that it can be traced and reviewed.

Testing Environment

URL / Location: [UAT instance URL of the ticketing tool]

Credentials (if required): [Username / Password – share separately, do not store in this document]

Test Cases

Test Case ID	Test Scenario	Test Steps	Expected Result	Actual Result	Pass/Fail
TC-001	Incident ticket auto-classified to correct category	1. Create a new ticket: "Cannot connect to VPN from home". 2. Submit the ticket. 3. Wait for the classification flow to run.	Category = Network, Subcategory = VPN; flow completes with no manual action.	[To be recorded during testing]	[Pass / Fail]

Test Case ID	Test Scenario	Test Steps	Expected Result	Actual Result	Pass/Fail
TC-002	Service request classified as Request, not Incident	1. Create a ticket: "Need access to shared finance folder". 2. Submit. 3. Check Ticket Type.	Ticket Type = Service Request; Category = Access Management.	[To be recorded during testing]	[Pass / Fail]
TC-003	Priority assigned from impact and urgency	1. Create a ticket: "Production payment system down for all users". 2. Submit. 3. Check Priority field.	Priority = P1 (Critical); impact and urgency set to High.	[To be recorded during testing]	[Pass / Fail]
TC-004	Ticket routed to the correct assignment group	1. Submit a ticket classified as Hardware / Laptop. 2. Check Assignment Group.	Assigned to the End-User Computing / Desktop Support group.	[To be recorded during testing]	[Pass / Fail]
TC-005	Low-confidence classification falls back to manual triage	1. Submit an ambiguous ticket: "It is not working". 2. Check classification result and queue.	Confidence is below the threshold; ticket goes to the Manual Triage queue with a "Needs Review" tag.	[To be recorded during testing]	[Pass / Fail]
TC-006	Ticket with missing description is handled	1. Create a ticket with the short description only. 2. Submit.	Flow does not fail; ticket is flagged for more information or sent to manual triage.	[To be recorded during testing]	[Pass / Fail]
TC-007	Non-English / mixed-language ticket	1. Submit a ticket in Hindi or mixed Hindi-English. 2. Check classification.	Ticket is classified correctly, or routed to manual triage if confidence is low.	[To be recorded during testing]	[Pass / Fail]
TC-008	Duplicate ticket detection	1. Submit a ticket. 2. Submit a near-identical ticket from the same user within 10 minutes.	Second ticket is flagged as a possible duplicate and linked to the first.	[To be recorded during testing]	[Pass / Fail]
TC-009	Manual override of classification	1. Open an auto-classified ticket. 2. Change Category and Assignment Group. 3. Save.	Changes are saved; override is recorded in the audit trail and not overwritten by the flow.	[To be recorded during testing]	[Pass / Fail]
TC-010	Classification audit log	1. Open a classified ticket. 2. View the activity log.	Log shows predicted category, confidence score, timestamp and flow version.	[To be recorded during testing]	[Pass / Fail]
TC-011	Bulk ticket load (performance)	1. Submit 100 tickets within 5 minutes. 2. Measure classification time per ticket.	All tickets are classified; average time is under 10 seconds; no failed runs.	[To be recorded during testing]	[Pass / Fail]

Test Case ID	Test Scenario	Test Steps	Expected Result	Actual Result	Pass/Fail
TC-012	Failure handling when the classification service is unavailable	1. Simulate the classification service being down. 2. Submit a ticket.	Ticket is still created and sent to Manual Triage; an error is logged and an alert is raised.	[To be recorded during testing]	[Pass / Fail]
TC-013	Notification to requester and assignee	1. Submit a ticket. 2. Check email / notification after classification.	Requester gets an acknowledgement; assignment group is notified.	[To be recorded during testing]	[Pass / Fail]
TC-014	Access control on flow configuration	1. Log in as a standard user. 2. Try to open the classification flow settings.	Access is denied; only admins can view or edit the configuration.	[To be recorded during testing]	[Pass / Fail]

Bug Tracking

Bug ID	Bug Description	Steps to reproduce	Severity	Status	Additional feedback
BG-001	[Describe the issue or bug encountered]	[Step 1] [Step 2] [Step 3]	[Low / Medium / High]	[Open / In Progress / Closed]	[Any additional comments or feedback]

Sign-off

Tester Name: [Name of Tester]

Date: [Date of Test Completion]

Signature: [Tester's Signature]

Project Manager Approval: [Name / Signature / Date]

Product Owner Approval: [Name / Signature / Date]

Notes

- Ensure that all test cases cover both positive and negative scenarios.
- Encourage testers to provide detailed feedback, including any suggestions for improvement.
- Bug tracking should include details such as severity, status, and steps to reproduce.
- Obtain sign-off from both the project manager and product owner before proceeding with deployment.
